

Phase 1 Analysis

✖ Major Gaps / Issues

1. No Real Agent Autonomy Yet

Claude/GPT are triggered in a loop but don't make decisions or spawn tools by themselves.

There's no graph-based orchestration or tool usage yet — it's just bouncing messages.

2. Transcript is Empty

Indicates that either:

The agent calls are malformed.

Messages are not being returned from the models.

Output handling broke due to incorrect chunk parsing.

3. Error-Prone OutputHandler

You hit repeated exceptions due to uninitialized content, improper chunk typing, or method signature mismatches (`update_error`, `finish`, etc.) — now fixed but fragile.

4. No Web UI or API Layer

Everything works via CLI — fine for testing, not for showcasing or scaling.

There's no admin dashboard or observer interface as we discussed.

🧠 Critical Missing Elements

Memory handling: You haven't implemented long-term memory via vector stores or JSON blob persistence. No retriever, summarizer, or LangChain memory module yet.

Persistent project state: Projects don't save structured progress (just raw transcripts).

Error-triggered Debugger: You drafted the prompt, but there's no runtime detection, auto-invocation, or self-healing yet.

Tool registration and calling: Static config only — no dynamic registration or execution pipeline for agents.

Code generation / file system writeback: There's no logic for the builder to create files, directories, or scaffold projects based on Claude/GPT output.
